Two-Dimensional Arrays

Review: One-Dimensional Array Example:

```
double temperature[10];
```

- ❖ The above declaration allocates memory for 10 floating-point values.
- ❖ Subscript of first element is 0.
- ❖ Subscript of last element is 9.

A floating-point temperature value can be placed in each memory position of the array.

Two-Dimensional Arrays (Matrices)

- A two-dimensional array is a set of numbers arranged in a grid with rows and columns.
- A two-dimensional array is defined using a data type declaration statement.
- General form:

`data_type array_name[row][column];`

- Example:

`int x[3][4];`

	x[0]	x[1]	x[2]	x[3]
x[0]				
x[1]				
x[2]				

Row is always first
and column second.

Twelve integer numbers
can be placed in this array.

Manipulating Array Elements

`int x[3][4], i, j;`

- ❖ Array `x` has 12 integer positions.
- ❖ The `x[0][0]` position is in the first row, first column.
- ❖ The `x[2][3]` position is in the last row, last column.

```
for(i=0; i<=2; i++)
{
    for(j=0; j<=3; j++)
    {
        x[i][j]=i*j;
    }
}
```

	x[0]	x[1]	x[2]	x[3]
x[0]				
x[1]				
x[2]				

Initializing Two-Dimensional Arrays

- Two-dimensional arrays can be initialized at the time they are declared.

NOTE: Use this technique **only** for very small data sets.

Example #1:

```
int sq[3][3] = {{2,3,-1},{0,-3,5},{2,6,3}};
```

	sq[0]	sq[1]	sq[2]
sq[0]			
sq[1]			
sq[2]			

Example #2:

```
int xy[][3] = {{1,0,1},{2,0,2},{3,0,3}};
```

The row size can be omitted **only if** the array is being initialized at compile time as shown in this example.

Input from a data file

- Example:

```
double shake[10][10];
```

```
int i, j;
```

```
FILE *seismic3;
```

```
seismic3 = fopen(inputfile, "r");
```

```
for(i=0; i<=9; i++)
```

```
{
```

```
    for(j=0; j<=9; j++)
```

```
    {
```

```
        fscanf(seismic3, "%lf", &shake[i][j]);
```

```
    }
```

```
}
```

Input file of seismic data.

```
1.4 2.4 3.7 4.8 . . .
5.3 5.6 4.6 6.8
3.3 3.3 2.6 2.7
```

```

Transposing Two-Dimensional Arrays

```
int i, j, base[3][3], tbase[3][3];
```

```
for(i=0; i<=2; i++)
```

```
{
```

```
    for(j=0; j<=2; j++)
```

```
    {
```

```
        tbase[j][i] = base[i][j];
```

```
    }
```

```
}
```

base array
